

IT Infrastructure

The basic principle of IT infrastructure development is ensuring failure-proof and highly efficient operation of the systems used, safety and protection of data, and using a united information space of the Company.

Availability of computer equipment at the Company

	2013		2014	
	total	need replacement	total	need replacement
PC and workstations	7,792	1,456	7,661	1,635
Server equipment	677	98	657	89

The decrease in the number of server equipment at the Company is due to greater project centralization and therefore transfer of processing to the Executive Staff facilities and to much better characteristics of new server equipment.

The insignificant decrease of the number of personal consumers at the Company is due to its loss of guaranteeing supplier functions and therefore reduction of the number of staff.
